      10/       0 :                     ;
      11/       0 :                     ;     This is the assembly source code that produces the same machine
      12/       0 :                     ;     op codes as shown by the first example (add two numbers) in the
      13/       0 :                     ;     Altair 8800 Operator’s Manual.
      14/       0 :                     ;
      15/       0 :                     ;     On a modern (as of 2020) Linux machine, install the
      16/       0 :                     ;     Macroassembler AS found at:
      17/       0 :                     ;
      18/       0 :                     ;         http://john.ccac.rwth-aachen.de:8000/as/
      19/       0 :                     ;
      20/       0 :                     ;     Then assemble this source file with the command:
      21/       0 :                     ;
      22/       0 :                     ;         asl -a -cpu 8080 -L -listradix 8 add.asm
      23/       0 :                     ;
      24/       0 :                     ;     to compare the generated list file (add.lst) to the octal machine
      25/       0 :                     ;     op codes provided in the manual.
      26/       0 :                     ;
      27/       0 :                     ;     However, if you have installed "most" -- you know you want it --
      28/       0 :                     ;     it is VERY instructive to instead assemble the source file with
      29/       0 :                     ;     the command:
      30/       0 :                     ;
      31/       0 :                     ;         asl -a -cpu 8080 -L -listradix 16 add.asm
      32/       0 :                     ;
      33/       0 :                     ;     This produces the same binary file (add.p) but changes the format
      34/       0 :                     ;     of the list file, displaying the machine op codes in hexadecimal,
      35/       0 :                     ;     rather than octal, and, together with the command:
      36/       0 :                     ;
      37/       0 :                     ;         most add.p
      38/       0 :                     ;
      39/       0 :                     ;      you can study the actual binary "executable" produced, and
      40/       0 :                     ;      "debug" it by finding the machine op codes (in hex) embedded
```
